LASER-ETCH: PAINT INFILL

*Standard Acid-etch sign with paint infill

WHAT IS?

Acid-Etch with Paint Infill

Acid-etching is a process where an acid solution is used to permanently mark or etch lettering, logos, or patterns into a metal surface. This creates a recessed design that becomes part of the material itself.

To enhance visibility and add vibrancy, the recessed areas are filled with black durable paint as a standard. A selection of custom colours are available; however, these are limited and may incur an additional cost.

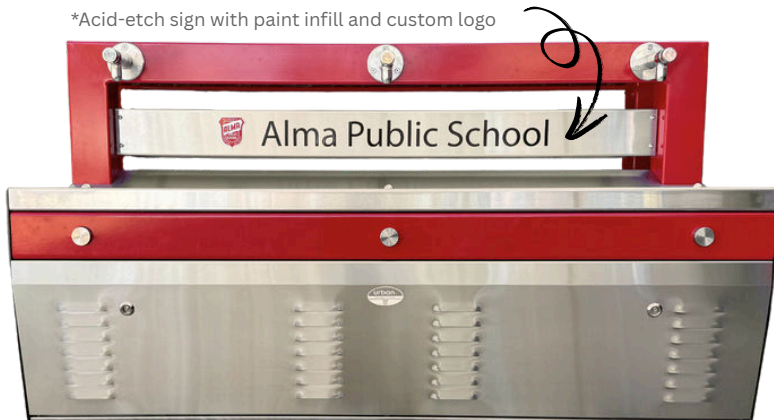

Key Benefits

- + **Highly Durable** – The etch is permanent and the paint is protected within the recessed areas, making it resistant to wear, vandalism, weather, and cleaning.
- + **Customisable** – Our acid-etch with paint infill option can be customised to include logos, custom fonts, infill icons, and even shaped designs, making it ideal for school crests, council emblems, or unique patterns that go beyond standard text.
- + **Low Maintenance** – Unlike surface printing, the recessed and painted design won't peel or easily fade.

VINYL WRAP CUSTOM SIGN

WHAT IS?

Vinyl Wrap Custom Sign

A vinyl wrap custom sign uses a high-quality printed film applied directly to the surface of a product. This method allows for full-colour graphics, detailed logos, and vibrant messaging that can cover larger areas or add striking visual elements.

The film is durable, weather-resistant, and designed to adhere securely to stainless steel and other materials.

Vinyl wrapping can be applied on the top signage panel and the button plate, with pricing calculated separately for each panel to allow flexibility in customisation.

Key Benefits

- + **Versatile Design** – Full-colour prints, patterns, and detailed graphics are possible.
- + **Customisable** – Logos, icons, shapes, and text can all be incorporated.
- + **Bold & Eye-Catching** – The printed finish delivers strong visual impact.
- + **Weather Resistant** – Designed to withstand outdoor conditions, UV, and general wear.
